Tokenizing

By tokenizing, you can conveniently split up text by word or by sentence. This will allow you to work with smaller pieces of text that are still relatively coherent and meaningful even outside of the context of the rest of the text. It's your first step in turning unstructured data into structured data, which is easier to analyze.

When you're analyzing text, you'll be tokenizing by word and tokenizing by sentence. Here's what both types of tokenization bring to the table:

Tokenizing by word: Words are like the atoms of natural language. They're the smallest unit of meaning that still makes sense on its own. Tokenizing your text by word allows you to identify words that come up particularly often. For example, if you were analyzing a group of job ads, then you might find that the word "Python" comes up often. That could suggest high demand for Python knowledge, but you'd need to look deeper to know more.

Tokenizing by sentence: When you tokenize by sentence, you can analyze how those words relate to one another and see more context. Are there a lot of negative words around the word "Python" because the hiring manager doesn't like Python? Are there more terms from the domain of herpetology than the domain of software development, suggesting that you may be dealing with an entirely different kind of python than you were expecting?

Here's how to import the relevant parts of NLTK so you can tokenize by word and by sentence:

import the relevant parts of NLTK so you can tokenize by word and by sentence:

```
[]: from nltk.tokenize import sent_tokenize, word_tokenize
```

Creating a string to tokenize. Here's a quote from Dune that you can use:

```
[]: example_string = """
Muad'Dib learned rapidly because his first training was in how to learn.
And the first lesson of all was the basic trust that he could learn.
It's shocking to find how many people do not believe they can learn,
and how many more believe learning to be difficult."""
```

use sent_tokenize() to split up example_string into sentences:

```
[]: sent_tokenize(example_string)
```

Tokenizing example string by word:

```
[]: word_tokenize(example_string)
```

```
[]: ["Muad'Dib",
      'learned',
      'rapidly',
      'because',
      'his',
      'first',
      'training',
      'was',
      'in',
      'how',
      'to',
      'learn',
      '.',
      'And',
      'the',
      'first',
      'lesson',
      'of',
      'all',
      'was',
      'the',
      'basic',
      'trust',
      'that',
```

```
'he',
'could',
'learn',
١.',
'It',
"'s",
'shocking',
'to',
'find',
'how',
'many',
'people',
'do',
'not',
'believe',
'they',
'can',
'learn',
١,١,
'and',
'how',
'many',
'more',
'believe',
'learning',
'to',
'be',
'difficult',
'.']
```

You got a list of strings that NLTK considers to be words, such as:

"Muad'Dib" 'training' 'how' But the following strings were also considered to be words:

"'s",' '.' See how"It's" was split at the apostrophe to give you 'It' and "'s", but "Muad'Dib" was left whole? This happened because NLTK knows that 'It' and"'s" (a contraction of "is") are two distinct words, so it counted them separately. But "Muad'Dib" isn't an accepted contraction like "It's", so it wasn't read as two separate words and was left intact.

1 Filtering Stop Words

Stop words are words that you want to ignore, so you filter them out of your text when you're processing it. Very common words like 'in', 'is', and 'an' are often used as stop words since they don't add a lot of meaning to a text in and of themselves.

Here's how to import the relevant parts of NLTK in order to filter out stop words:

```
[]: from nltk.corpus import stopwords from nltk.tokenize import word_tokenize
```

Here's a quote from Worf that you can filter:

```
[]: worf_quote = "Sir, I protest. I am not a merry man!"
```

Now tokenize worf quote by word and store the resulting list in words in quote:

```
[]: words_in_quote = word_tokenize(worf_quote)
words_in_quote
```

```
[]: ['Sir', ',', 'I', 'protest', '.', 'I', 'am', 'not', 'a', 'merry', 'man', '!']
```

You have a list of the words in worf_quote, so the next step is to create a set of stop words to filter words_in_quote. For this example, you'll need to focus on stop words in "english":

```
[ ]: stop_words = set(stopwords.words("english"))
```

Now, create an empty list to hold the words that make it past the filter:

```
[]: filtered_list = []
```

You created an empty list, filtered_list, to hold all the words in words_in_quote that aren't stop words. Now you can use stop_words to filter words_in_quote:

```
[]: for word in words_in_quote:
    if word.casefold() not in stop_words:
        filtered_list.append(word)
```

You iterated over words_in_quote with a for loop and added all the words that weren't stop words to filtered_list. You used .casefold() on word so you could ignore whether the letters in word were uppercase or lowercase. This is worth doing because stopwords.words('english') includes only lowercase versions of stop words.

Alternatively, you could use a list comprehension to make a list of all the words in your text that aren't stop words:

```
[]: filtered_list = [
          word for word in words_in_quote if word.casefold() not in stop_words
]
```

When you use a list comprehension, you don't create an empty list and then add items to the end of it. Instead, you define the list and its contents at the same time. Using a list comprehension is often seen as more Pythonic.

Take a look at the words that ended up in filtered list:

```
[]: filtered_list
```

```
[]: ['Sir', ',', 'protest', '.', 'merry', 'man', '!']
```

You filtered out a few words like 'am' and 'a', but you also filtered out 'not', which does affect the overall meaning of the sentence. (Worf won't be happy about this.)

Words like 'I' and 'not' may seem too important to filter out, and depending on what kind of analysis you want to do, they can be. Here's why:

'I' is a pronoun, which are context words rather than content words:

Content words give you information about the topics covered in the text or the sentiment that the author has about those topics.

Context words give you information about writing style. You can observe patterns in how authors use context words in order to quantify their writing style. Once you've quantified their writing style, you can analyze a text written by an unknown author to see how closely it follows a particular writing style so you can try to identify who the author is.

'not' is technically an adverb but has still been included in NLTK's list of stop words for English. If you want to edit the list of stop words to exclude 'not' or make other changes, then you can download it.

So, 'I' and 'not' can be important parts of a sentence, but it depends on what you're trying to learn from that sentence.

2 Stemming

Stemming is a text processing task in which you reduce words to their root, which is the core part of a word. For example, the words "helping" and "helper" share the root "help." Stemming allows you to zero in on the basic meaning of a word rather than all the details of how it's being used. NLTK has more than one stemmer, but you'll be using the Porter stemmer.

Here's how to import the relevant parts of NLTK in order to start stemming:

```
[]: from nltk.stem import PorterStemmer from nltk.tokenize import word_tokenize
```

Now that you're done importing, you can create a stemmer with PorterStemmer():

```
[ ]: stemmer = PorterStemmer()
```

The next step is for you to create a string to stem. Here's one you can use:

```
[]: string_for_stemming = """

The crew of the USS Discovery discovered many discoveries.

Discovering is what explorers do."""
```

Before you can stem the words in that string, you need to separate all the words in it:

```
[ ]: words = word_tokenize(string_for_stemming)
```

Now that you have a list of all the tokenized words from the string, take a look at what's in words:

```
[]: words
```

```
[]: ['The', 'crew',
```

```
'of',
'the',
'USS',
'Discovery',
'discovered',
'many',
'discoveries',
'.',
'Discovering',
'is',
'what',
'explorers',
'do',
'.']
```

Create a list of the stemmed versions of the words in words by using stemmer.stem() in a list comprehension:

```
[]: stemmed_words = [stemmer.stem(word) for word in words]
```

Take a look at what's in stemmed_words:

```
[]: stemmed_words
```

```
[]: ['the',
      'crew',
      'of',
      'the',
      'uss',
      'discoveri',
      'discov',
      'mani',
      'discoveri',
      ١.,
      'discov',
      'is',
      'what',
      'explor',
      'do',
      '.']
```

3 Tagging Parts of Speech

Part of speech is a grammatical term that deals with the roles words play when you use them together in sentences. Tagging parts of speech, or POS tagging, is the task of labeling the words in your text according to their part of speech.

In English, there are eight parts of speech:

Some sources also include the category articles (like "a" or "the") in the list of parts of speech, but other sources consider them to be adjectives. NLTK uses the word determiner to refer to articles.

Here's how to import the relevant parts of NLTK in order to tag parts of speech:

```
[ ]: from nltk.tokenize import word_tokenize
```

Now create some text to tag. You can use this Carl Sagan quote:

```
[]: sagan_quote = """

If you wish to make an apple pie from scratch,
you must first invent the universe."""
```

Use word_tokenize to separate the words in that string and store them in a list:

```
[]: words_in_sagan_quote = word_tokenize(sagan_quote)
```

Now call nltk.pos_tag() on your new list of words:

```
[]: nltk.pos_tag(words_in_sagan_quote)
```

```
[]: [('If', 'IN'),
      ('you', 'PRP'),
      ('wish', 'VBP'),
      ('to', 'TO'),
      ('make', 'VB'),
      ('an', 'DT'),
      ('apple', 'NN'),
      ('pie', 'NN'),
      ('from', 'IN'),
      ('scratch', 'NN'),
      (',', ','),
      ('you', 'PRP'),
      ('must', 'MD'),
      ('first', 'VB'),
      ('invent', 'VB'),
      ('the', 'DT'),
      ('universe', 'NN'),
      ('.', '.')]
```

All the words in the quote are now in a separate tuple, with a tag that represents their part of speech.

```
[]: jabberwocky_excerpt = """
'Twas brillig, and the slithy toves did gyre and gimble in the wabe:
all mimsy were the borogoves, and the mome raths outgrabe."""
```

Use word_tokenize to separate the words in the excerpt and store them in a list:

```
[ ]: words_in_excerpt = word_tokenize(jabberwocky_excerpt)
```

Call nltk.pos tag() on your new list of words:

```
[]: nltk.pos_tag(words_in_excerpt)
```

```
[]: [("'Twas", 'CD'),
      ('brillig', 'NN'),
      (',', ','),
      ('and', 'CC'),
      ('the', 'DT'),
      ('slithy', 'JJ'),
      ('toves', 'NNS'),
      ('did', 'VBD'),
      ('gyre', 'NN'),
      ('and', 'CC'),
      ('gimble', 'JJ'),
      ('in', 'IN'),
      ('the', 'DT'),
      ('wabe', 'NN'),
      (':', ':'),
      ('all', 'DT'),
      ('mimsy', 'NNS'),
      ('were', 'VBD'),
      ('the', 'DT'),
      ('borogoves', 'NNS'),
      (',', ','),
      ('and', 'CC'),
      ('the', 'DT'),
      ('mome', 'JJ'),
      ('raths', 'NNS'),
      ('outgrabe', 'RB'),
      ('.', '.')]
```

Accepted English words like 'and' and 'the' were correctly tagged as a conjunction and a determiner, respectively. The gibberish word 'slithy' was tagged as an adjective, which is what a human English speaker would probably assume from the context of the poem as well. Way to go, NLTK!

4 Lemmatizing

Now that you're up to speed on parts of speech, you can circle back to lemmatizing. Like stemming, lemmatizing reduces words to their core meaning, but it will give you a complete English word that

makes sense on its own instead of just a fragment of a word like 'discoveri'. Here's how to import the relevant parts of NLTK in order to start lemmatizing:

[]: from nltk.stem import WordNetLemmatizer

Create a lemmatizer to use:

[]: lemmatizer = WordNetLemmatizer()

Let's start with lemmatizing a plural noun:

```
[]: lemmatizer.lemmatize("scarves")
```

[]: 'scarf'

"scarves" gave you 'scarf', so that's already a bit more sophisticated than what you would have gotten with the Porter stemmer, which is 'scarv'. Next, create a string with more than one word to lemmatize:

```
[]: string_for_lemmatizing = "The friends of DeSoto love scarves."
```

Now tokenize that string by word:

```
[ ]: words = word_tokenize(string_for_lemmatizing)
```

Here's your list of words:

```
[]: words
```

```
[]: ['The', 'friends', 'of', 'DeSoto', 'love', 'scarves', '.']
```

Create a list containing all the words in words after they've been lemmatized:

```
[]: lemmatized_words = [lemmatizer.lemmatize(word) for word in words]
```

Here's the list you got:

```
[]: lemmatized_words
```

```
[]: ['The', 'friend', 'of', 'DeSoto', 'love', 'scarf', '.']
```

That looks right. The plurals 'friends' and 'scarves' became the singulars 'friend' and 'scarf'.

But what would happen if you lemmatized a word that looked very different from its lemma? Try lemmatizing "worst":

```
[]: lemmatizer.lemmatize("worst")
```

[]: 'worst'

You got the result 'worst' because lemmatizer.lemmatize() assumed that "worst" was a noun. You can make it clear that you want "worst" to be an adjective:

```
[]: lemmatizer.lemmatize("worst", pos="a")
```

[]: 'bad'

The default parameter for pos is 'n' for noun, but you made sure that "worst" was treated as an adjective by adding the parameter pos="a". As a result, you got 'bad', which looks very different from your original word and is nothing like what you'd get if you were stemming. This is because "worst" is the superlative form of the adjective 'bad', and lemmatizing reduces superlatives as well as comparatives to their lemmas.

Now that you know how to use NLTK to tag parts of speech, you can try tagging your words before lemmatizing them to avoid mixing up homographs, or words that are spelled the same but have different meanings and can be different parts of speech.

5 Chunking

While tokenizing allows you to identify words and sentences, chunking allows you to identify phrases. It makes use of POS tags to group words and apply chunk tags to those groups. Chunks don't overlap, so one instance of a word can be in only one chunk at a time.

```
[]: from nltk.tokenize import word_tokenize
```

Before you can chunk, you need to make sure that the parts of speech in your text are tagged, so create a string for POS tagging. You can use this quote from The Lord of the Rings:

```
[]: lotr_quote = "It's a dangerous business, Frodo, going out your door."
```

Now tokenize that string by word:

```
[ ]: words_in_lotr_quote = word_tokenize(lotr_quote)
words_in_lotr_quote
```

Now you've got a list of all of the words in lotr_quote.

The next step is to tag those words by part of speech:

```
[]: lotr_pos_tags = nltk.pos_tag(words_in_lotr_quote) lotr_pos_tags
```

You've got a list of tuples of all the words in the quote, along with their POS tag. In order to chunk, you first need to define a chunk grammar.

Create a chunk grammar with one regular expression rule:

```
[]: grammar = "NP: {<DT>?<JJ>*<NN>}"
```

NP stands for noun phrase. You can learn more about noun phrase chunking in Chapter 7 of Natural Language Processing with Python—Analyzing Text with the Natural Language Toolkit.

According to the rule you created, your chunks:

Start with an optional (?) determiner ('DT') Can have any number (*) of adjectives (JJ) End with a noun () Create a chunk parser with this grammar:

```
[]: chunk_parser = nltk.RegexpParser(grammar)
```

Now try it out with your quote:

```
[ ]: tree = chunk_parser.parse(lotr_pos_tags)
```

here's how you can see a visual representation of this tree:

```
[ ]: tree.draw()
```

You got two noun phrases:

'a dangerous business' has a determiner, an adjective, and a noun. 'door' has just a noun. Now that you know about chunking, it's time to look at chinking.

```
[]: import tkinter from nltk.draw.tree import draw_trees
```

```
m =tkinter.Tk()
m.mainloop()
tree.draw()
```

6 Chinking

Chinking is used together with chunking, but while chunking is used to include a pattern, chinking is used to exclude a pattern.

Let's reuse the quote you used in the section on chunking. You already have a list of tuples containing each of the words in the quote along with its part of speech tag:

```
[]: lotr_pos_tags
```

The next step is to create a grammar to determine what you want to include and exclude in your chunks. This time, you're going to use more than one line because you're going to have more than one rule. Because you're using more than one line for the grammar, you'll be using triple quotes ("""):

```
[]: grammar = """
Chunk: {<.*>+}
}<JJ>{"""
```

The first rule of your grammar is $\{<.>+\}$. This rule has curly braces that face inward $(\{\}\})$ because it's used to determine what patterns you want to include in you chunks. In this case, you want to include everything: <.>+.

The second rule of your grammar is }{. This rule has curly braces that face outward (){) because it's used to determine what patterns you want to exclude in your chunks. In this case, you want to exclude adjectives: .

Create a chunk parser with this grammar:

```
[]: chunk_parser = nltk.RegexpParser(grammar)
```

Now chunk your sentence with the chink you specified:

```
[]: tree = chunk_parser.parse(lotr_pos_tags)
```

You get this tree as a result:

```
[]: print(tree)
```

```
(S
  (Chunk It/PRP 's/VBZ a/DT)
  dangerous/JJ
  (Chunk
    business/NN
    ,/,
    Frodo/NNP
    ,/,
    going/VBG
    out/RP
    your/PRP$
    door/NN
    ./.))
```

In this case, ('dangerous', 'JJ') was excluded from the chunks because it's an adjective (JJ). But that will be easier to see if you get a graphic representation again:

You get this visual representation of the tree:

```
[]: tree.draw()
```

Using Named Entity Recognition (NER)

Named entities are noun phrases that refer to specific locations, people, organizations, and so on. With named entity recognition, you can find the named entities in your texts and also determine what kind of named entity they are.

Here's the list of named entity types from the NLTK book: NE type Examples ORGANIZATION Georgia-Pacific Corp., WHO PERSON Eddy Bonte, President Obama LOCATION Murray River, Mount Everest DATE June, 2008-06-29 TIME two fifty a m, 1:30 p.m. MONEY 175 million Canadian dollars, GBP 10.40 PERCENT twenty pct, 18.75 % FACILITY Washington Monument, Stonehenge GPE South East Asia, Midlothian You can use nltk.ne_chunk() to recognize named entities.

You can use nltk.ne_chunk() to recognize named entities. Let's use lotr_pos_tags again to test it out:

```
[]: # to recognize named entities
tree = nltk.ne_chunk(lotr_pos_tags)
tree.draw()
```

Now take a look at the visual representation:

```
[]: # set binary=True if you just want to know what the named entities are # but not what kind of named entity they are tree = nltk.ne_chunk(lotr_pos_tags, binary=True) tree.draw()
```

That's how you can identify named entities! But you can take this one step further and extract named entities directly from your text. Create a string from which to extract named entities. You can use this quote from The War of the Worlds:

Then create a function to extract named entities:

```
[]: quote = """
     Men like Schiaparelli watched the red planet-it is odd, by-the-bye, that
     for countless centuries Mars has been the star of war-but failed to
     interpret the fluctuating appearances of the markings they mapped so well.
     All that time the Martians must have been getting ready.
     During the opposition of 1894 a great light was seen on the illuminated
     part of the disk, first at the Lick Observatory, then by Perrotin of Nice,
     and then by other observers. English readers heard of it first in the
     issue of Nature dated August 2."""
     def extract_ne(quote):
           tokenize by word
         words = word_tokenize(quote)
           apply part of speech tags to those words
         tags = nltk.pos tag(words)
           extract named entities based on those tags
         tree = nltk.ne_chunk(tags, binary=True)
         return set(
             " ".join(i[0] for i in t)
             for t in tree
             if hasattr(t, "label") and t.label() == "NE"
     # gather all named entities, with no repeats
     extract ne(quote)
```

[]: {'Lick Observatory', 'Mars', 'Nature', 'Perrotin', 'Schiaparelli'}

With this function, you gather all named entities, with no repeats. In order to do that, you tokenize by word, apply part of speech tags to those words, and then extract named entities based on those tags. Because you included binary=True, the named entities you'll get won't be labeled more specifically. You'll just know that they're named entities.

Take a look at the information you extracted:

You missed the city of Nice, possibly because NLTK interpreted it as a regular English adjective, but you still got the following:

An institution: 'Lick Observatory' A planet: 'Mars' A publication: 'Nature' People: 'Perrotin', 'Schiaparelli' That's some pretty decent variety!

7 Getting Text to Analyze

Now that you've done some text processing tasks with small example texts, you're ready to analyze a bunch of texts at once. A group of texts is called a corpus. NLTK provides several corpora covering everything from novels hosted by Project Gutenberg to inaugural speeches by presidents of the United States.

In order to analyze texts in NLTK, you first need to import them. This requires nltk.download("book"), which is a pretty big download:

```
[ ]: from nltk.book import *
```

```
*** Introductory Examples for the NLTK Book ***
Loading text1, ..., text9 and sent1, ..., sent9
Type the name of the text or sentence to view it.
Type: 'texts()' or 'sents()' to list the materials.
text1: Moby Dick by Herman Melville 1851
text2: Sense and Sensibility by Jane Austen 1811
text3: The Book of Genesis
text4: Inaugural Address Corpus
text5: Chat Corpus
text5: Chat Corpus
text6: Monty Python and the Holy Grail
text7: Wall Street Journal
text8: Personals Corpus
text9: The Man Who Was Thursday by G . K . Chesterton 1908
```

You now have access to a few linear texts (such as Sense and Sensibility and Monty Python and the Holy Grail) as well as a few groups of texts (such as a chat corpus and a personals corpus). Human nature is fascinating, so let's see what we can find out by taking a closer look at the personals corpus!

This corpus is a collection of personals ads, which were an early version of online dating. If you wanted to meet someone, then you could place an ad in a newspaper and wait for other readers to respond to you.

8 Using a Concordance

When you use a concordance, you can see each time a word is used, along with its immediate context. This can give you a peek into how a word is being used at the sentence level and what words are used with it.

Let's see what these good people looking for love have to say! The personals corpus is called text8, so we're going to call .concordance() on it with the parameter "man":

[]: text3.concordance("light")

Displaying 11 of 11 matches:

waters . And God said , Let there be light : and there was light . And God saw , Let there be light : and there was light . And God saw the light , that it wa nd there was light . And God saw the light , that it was good : and God divided at it was good : and God divided the light from the darkness . And God called to om the darkness . And God called the light Day , and the darkness he called Nig the firmament of the heaven to give light upon the ear and it was so . And God made two great lights ; the greater light to rule the day , and the lesser light to rule the day , and the lesser light to rule the nighe made the stars al the firmament of the heaven to give light upon the earth , And to rule over the dover the night , and to divide the light from the darkne and God saw that it spoken . As soon as the morning was light , the men were sent away , they and

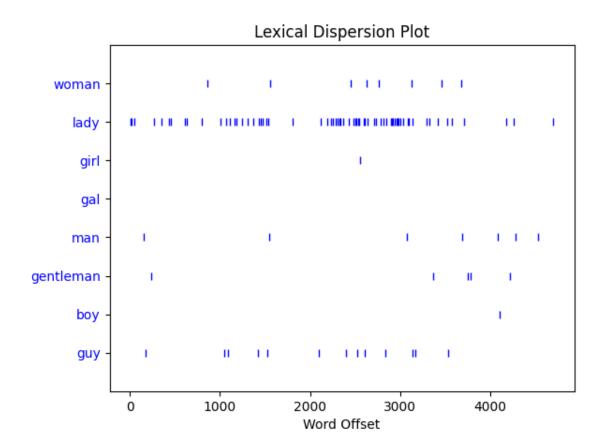

[]: text8.concordance("woman")

Displaying 11 of 11 matches:

at home . Seeking an honest , caring woman , slim or med . build , who enjoys t thy man 37 like to meet full figured woman for relationship . 48 slim , shy , S rry . MALE 58 years old . Is there a Woman who would like to spend 1 weekend a other interests . Seeking Christian Woman for fship , view to rship . SWM 45 D ALE 60 - burly beared seeks intimate woman for outings n / s s / d F / ston / P ington . SCORPIO 47 seeks passionate woman for discreet intimate encounters SEX le dad . 42 , East sub . 5 " 9 seeks woman 30 + for f / ship relationship TALL personal trainer looking for married woman age open for fun MARRIED Dark guy 37 rinker , seeking slim - medium build woman who is happy in life , age open . AC . 0 . TERTIARY Educated professional woman , seeks professional , employed man real romantic , age 50 - 65 y . o . WOMAN OF SUBSTANCE 56 , 59 kg ., 50 , fit

9 Making a Dispersion Plot

You can use a dispersion plot to see how much a particular word appears and where it appears. So far, we've looked for "man" and "woman", but it would be interesting to see how much those words are used compared to their synonyms:

Each vertical blue line represents one instance of a word. Each horizontal row of blue lines represents the corpus as a whole. This plot shows that:

"lady" was used a lot more than "woman" or "girl". There were no instances of "gal".

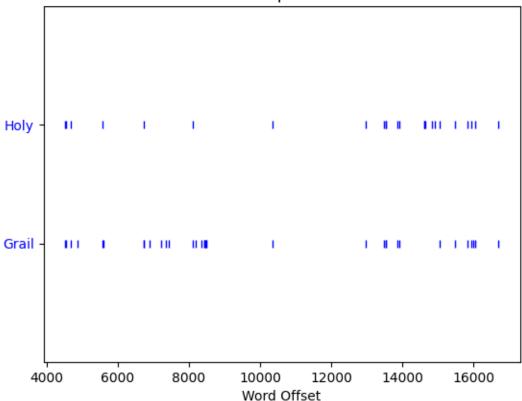

"man" and "guy" were used a similar number of times and were more common than "gentleman" or "boy".

You use a dispersion plot when you want to see where words show up in a text or corpus. If you're analyzing a single text, this can help you see which words show up near each other. If you're analyzing a corpus of texts that is organized chronologically, it can help you see which words were being used more or less over a period of time.

Staying on the theme of romance, see what you can find out by making a dispersion plot for Sense and Sensibility, which is text2. Jane Austen novels talk a lot about people's homes, so make a dispersion plot with the names of a few homes:

```
[]: text6.dispersion_plot(
          ["Holy", "Grail"]
)
```

10 Making a Frequency Distribution

With a frequency distribution, you can check which words show up most frequently in your text. FreqDist is a subclass of collections.Counter.

```
[]: from nltk import FreqDist
frequency_distribution = FreqDist(text8)
print(frequency_distribution)
```

<FreqDist with 1108 samples and 4867 outcomes>

Since 1108 samples and 4867 outcomes is a lot of information, start by narrowing that down. Here's how to see the 20 most common words in the corpus:

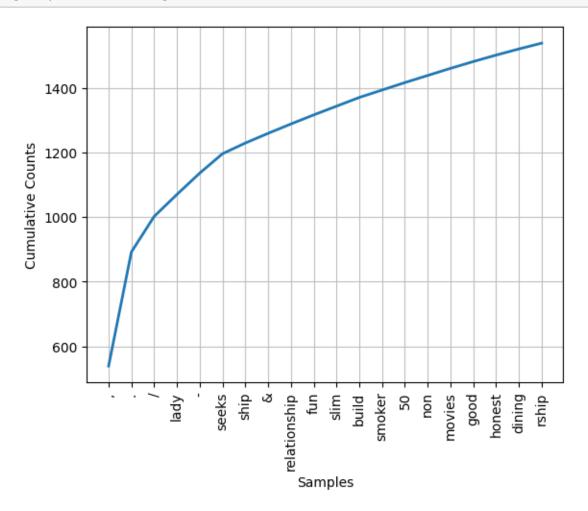

```
[]: frequency_distribution.most_common(20)
```

```
[]: [(',', 539),
('.', 353),
('/', 110),
```

```
('for', 99),
      ('and', 74),
      ('to', 74),
      ('lady', 68),
      ('-', 66),
      ('seeks', 60),
      ('a', 52),
      ('with', 44),
      ('S', 36),
      ('ship', 33),
      ('&', 30),
      ('relationship', 29),
      ('fun', 28),
      ('in', 27),
      ('slim', 27),
      ('build', 27),
      ('o', 26)]
[]: # Create a list of all of the words in text8 that aren't stop words
     meaningful words = [
         word for word in text8 if word.casefold() not in stop_words
    ]
[]: # make a frequency distribution of words that aren't stopwords
     frequency_distribution = FreqDist(meaningful_words)
[]: # peek at most common 20 words
     frequency_distribution.most_common(20)
[]: [(',', 539),
      ('.', 353),
      ('/', 110),
      ('lady', 68),
      ('-', 66),
      ('seeks', 60),
      ('ship', 33),
      ('&', 30),
      ('relationship', 29),
      ('fun', 28),
      ('slim', 27),
      ('build', 27),
      ('smoker', 23),
      ('50', 23),
      ('non', 22),
      ('movies', 22),
      ('good', 21),
      ('honest', 20),
```

```
('dining', 19), ('rship', 18)]
```

```
[]:  # plot a graph for analysis frequency_distribution.plot(20, cumulative=True)
```

[]: <AxesSubplot: xlabel='Samples', ylabel='Cumulative Counts'>

10.1 Finding Collocations

A collocation is a sequence of words that shows up often

[]: # To see pairs of words that come up often in your corpus text8.collocations()

would like; medium build; social drinker; quiet nights; non smoker; long term; age open; Would like; easy going; financially secure; fun times; similar interests; Age open; weekends away; poss rship; well

presented; never married; single mum; permanent relationship; slim build

- []: # Start by creating a list of the lemmatized versions of all the words in text8 lemmatized_words = [lemmatizer.lemmatize(word) for word in text8]
- []: # to be able to do the linguistic processing tasks, make an NLTK text with this list

 new_text = nltk.Text(lemmatized_words)

 # get collocations

 new_text.collocations()

medium build; social drinker; non smoker; quiet night; long term; would like; age open; easy going; financially secure; Would like; fun time; similar interest; Age open; weekend away; well presented; never married; single mum; permanent relationship; year old; slim build
